

SCENAR TECHNOLOGY EXPLAINED

The Scenar 97.4

Background

When the Soviet Union sent Cosmonauts into space, they developed a way of maintaining the good health of their space travellers. This was achieved without the use of pharmaceuticals. They could not allow drugs to enter the water supply in an environment where recycling of water supplies is essential. There were space and weight restrictions so they developed Self-Controlled Energy Neuron Adaptive Regulation. S.C.E.N.A.R.

The “ Startrek” device: The Scenar is hand held, and approximately the same size as a TV remote control. Developed by a team of top Russian scientists and doctors based at Sochi University.

They were tasked to find a way of coping with any illness in the lightest, smallest and most energy efficient way. Two of this team received the Order of Lenin (equivalent to a Nobel Prize.)

Head scientist Professor Revenko claimed that there were very few illnesses Scenar could not treat an often cure.

How it works

There is data for well over 50,000 successful treatments and there are more that 3,200 Scenar practitioners world-wide. Safety certification has been granted in Russia and in Europe. Using only a 9 volt battery, the Scenar stimulates the body’s own pharmacy with harmless electrical impulses via skin nerves. The brain mediates a bio-energy feedback by altering output every few milliseconds. No two successive impulses are the same. There is a natural, dynamic dialogue between brain and body. The process activates releases of biological activators such as neuropeptides. 5 HT and other body mind stimulators. Biofeedback elements introduce the scope for remarkably rapid healing, as changing fixed resonances and a repetitive central nervous system pattern restores integration.

The aim is to stimulate the body’s own endogenous energies to effect the cure, using as a mediator out own internal pharmacy of neuropeptides. This allows that body its own choice of healing ingredients. Through biofeedback and interaction is formed between the tissues and the instrument. Each new signal evolves as a new output. No two consecutive signals from the device are the same. This allows the treatment to be truly dynamic, adjusting changes in the body through time and in different physiological states.

Results

A wide variety of trained practitioners have accumulated considerable experience and this shows the ability of Scenar to generate healing in hitherto incurable illnesses, as was as common maladies of the mind, body and spirit. Training in the technology and methods are readily available, together with user-friendly manuals and support systems.

However, four of the original team felt they had designed a very worthwhile system, capable of changing the face of medicine, and decided to take it onto the open market. So far, around 600 doctors in Russia are using it as their principal treatment modality and it is now available to select and trained practitioners in the West. Virtual medicine has crossed-over into the mainstream.

The promise of a small hand held device that is capable of curing most illness, such as was portrayed in the cult 1960s TV series "Star Trek" has become a reality.

Operation

The device weighs around 300 grams, resembles a TV remote control and is powered by an ordinary 9-volt battery. It is placed on the skin of the chest, head, abdomen or any diseased part, where it collects electromagnetic signals. These are then modulated according to the on-board software programme and played back to the tissues. Essentially, Scenar is using the patient's own endogenous signals on a cybernetic feedback basis, scanning and re-transmitting many times a second. As described to me by one of the developers, the device "evolves" a new signal pattern for the disordered tissues, the machine literally entering into an information dialogue with the body. New frequencies and energy patterns are established, which in turn become fresh input signals, to be further modified, and so on. This output-equals new input is much the way that fractals are generated. On the premise that disease signals are generally fixed and unnatural, anything, which breaks up the existing order, has the capability of disease busting.

Clinical Aspects

The device is very safe; the impulse times are very short. No pain is usually felt but the patient is aware of a tingling sensation while it works. The practitioner seeks for what the Russians term asymmetry, meaning something different about the tissue characteristics in the vicinity. There are five main criteria.

- Discoloration (reddening or pallor)
- Sensation (Numbness or hyper-aesthesia)
- " Stickiness" in which the machine drags with a magnet-like quality as it is drawn over certain tracts of the skin.
- Sound changes (The machine begins to chatter electronically as it hits certain zones)
- Change in numerical output display.

Even though it may not coincide with the obvious area of symptoms or pathology, the important point is to treat the asymmetry. For reasons we do not fully understand, when this is eliminated, recovery will rapidly follow.

Summary

A summary of findings in different clinical groups on 50,000 Scenar doctors and other practitioners includes cumulative percentages in which “ effectiveness” is defined as a cure of 66% of cases and some improvement in 33% if cases.

CIRCULATORY	82%
Musculoskeletal	79%
Respiratory	84%
Ear and Mastoid	82%
Gastrointestinal	93%
Eye and adnexae	93%
Genito-urinary	89%
Mouth/Jaw/Saliva glands	91%
Gynae and Obstetrics	78%
Depression	95%

This list is far from exhaustive and I have been able to establish that there are many other areas in which Scenar is highly effective. For example, there is a current 98% cure rate achievement for benign prostate hypertrophy and in the case of acute mastitis the device is 100% effective to date. Nothing I know of can come close to its figures against frigidity, impotence and infertility (60% percentile)

There are remarkably few contradictions, notably heart pacemakers and, after so many years, a complete absence of negative side effects. Scenar technology can be used as a valuable addition to other therapies or could be a stand-alone treatment. The extra-ordinary feature is that the same small device can be used to treat the heart of one patient, the knee of the next, the breasts and adnexa of the next – all relying one small battery as an energy source.

Case Studies

Male, 69 years old

This man who was a gardener by profession had chronic suppurating osteomyelitis of the foot that could not be controlled. He was scheduled for an amputation of the lower leg in four days time, largely due to intractable pain. Someone decided to try a Scenar device on him. It was run over the affected limb about 30 minutes.

Next day, the pain had vanished for the first time in 8 months. Later that day another 30-minute treatment was given. By the next morning the recovery was so dramatic the amputation was called off. A third treatment was given seven days after the first Scenar this man was back at work, digging in the garden. His leg has completely recovered.

Female, age 68 years

This lady had attended for successful treatment of her asthma. She commented on painful arthritic knees. I decided to try the Scenar. In order to gauge the effectiveness of the treatment. I suggested that we concentrate on the left knee only, so that she could compare any improvements with the status of the right knee. Next morning she rang and was delighted that the pain had vanished from both knees. One week later, as of the time she returned to the UK, she had no further pain.

Female age 41 years

This lady is the presenter of a radio program on which I appear each month as the visiting alternative doctor. On this occasion she was struggling with her hay- fever, with streaming eyes and nose and constant sniffing which sounded awful on-air.

In a 3-minute gas for advertisements I grabbed the Scenar device and gave her a fast treatment over the forehead and cheeks. Just before going back on-air she breather in and was delighted to note that virtually all symptoms had vanished. She needed a further treatment 2 days later, as the symptoms were back. But again just a few minutes cleared he sinuses completely.

She has opted for regular treatments.

Girl aged 4 years

At the first meeting – speech was completely absent and she had a severe spasticity. To open the thighs, a padded sheet was rolled up and put between the legs. The girl could not stand, sit or walk.

After the first course of SCENAR therapy (6 sessions), in combination with the TMB blanket, the child started to speak some words and there was no need for the padded sheet. After the second course of treatment the girl repeated absolutely everything she heard, sat without support and tried to draw. After the third course of treatment the girl started telling stories. Her mother had noted the appearance of imaginative thinking. The girl started to draw, walk, and hold her mother's hand. The nistagn and squint were considerably reduced. The girl became flirtatious and demanding in her choice of clothes. After the fourth course of treatment she created stories and fairy tales, acted furtively, walked independently and tried to run, sometimes falling and hurting herself. Her appearance was considerably better.

Woman aged 75 years

Chronic pain for all of that time, very little sleep, bad back, problem with walking. After 10 treatments reports " For the first time in 50 years I am pain-free I can sit up in bed, I keep forgetting my stick".

It is advisable to have a course of minimum 6 treatments for chronic cases; i.e. something you have had for more than 1 month. For recent accidents 2 treatments are usually enough.
